

DREAD Risk Scores

Damage, Reproducibility, Exploitability, Affected users, and Discoverability (1-10 each, averaged). These scores are a team-consensus starting point, not an absolute measurement.

Table 3: Metasploitable-2 DREAD Score

Finding	D	R	E	A	D	Avg	Risk
Backdoor services (UnrealIRCd / bind shell)	10	10	10	10	8	9.6	Critical
VNC weak password	8	9	7	6	8	7.6	High
NFS world-readable	5	9	8	4	7	6.6	Medium
rlogin weak authentication	7	8	6	5	6	6.4	Medium
Samba Badlock	7	6	5	5	6	5.8	Medium

EXAMPLE REASONING (BACKDOOR SERVICES)

- Damage (10): grants direct command execution as the service's user, commonly root - total compromise, not partial.
- Reproducibility (10): a static, always-listening feature of the software; works identically every time.
- Exploitability (10): a single command or Metasploit module, no password or chained steps required.
- Affected users (10): compromise extends to the whole host, not just the backdoored service.
- Discoverability (8): found immediately by a default vulnerability scan, though it does require that scan step first some teams may justify scoring this a 9 or 10.

Table 4: Windows Server 2022 DREAD Score

Finding	D	R	E	A	D	Avg	Risk
SMB Signing Disabled	9	9	8	8	9	8.6	High
Weak Password Policy	8	9	9	8	9	8.6	High
Remote Code Execution	10	8	8	9	7	8.4	High
Reverse Shell	9	8	7	8	6	7.6	High
Missing Monitoring	8	9	8	9	8	8.4	High
Anonymous Enumeration	6	8	8	7	9	7.6	Medium
Open SMB Port	7	10	8	8	10	8.6	High
